Lesson 02 Demo 01

Creating a React Application Using React Components

Objective: To create a new React application using a React component to display a desired text, demonstrating the process of setting up a React project using the Vite framework

Tools required: Visual Studio Code and Node.js

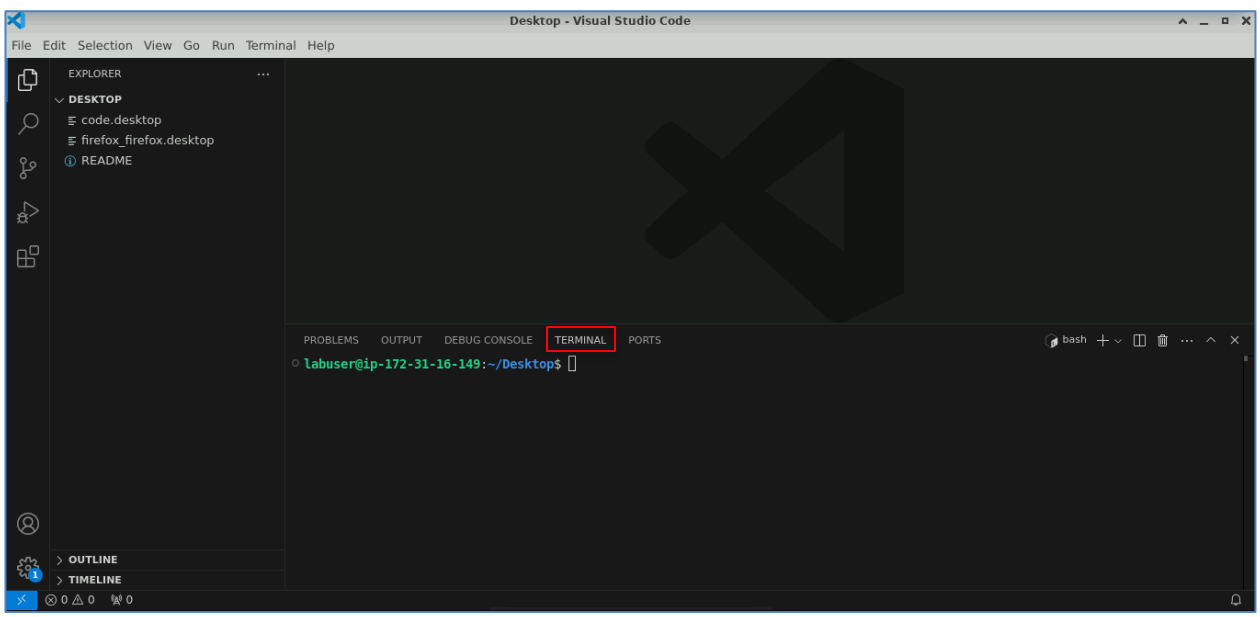
Prerequisites: None

Steps to be followed:

1. Set up a new React project using Vite
2. Create a React component
3. Import and use the component
4. Run and verify the application

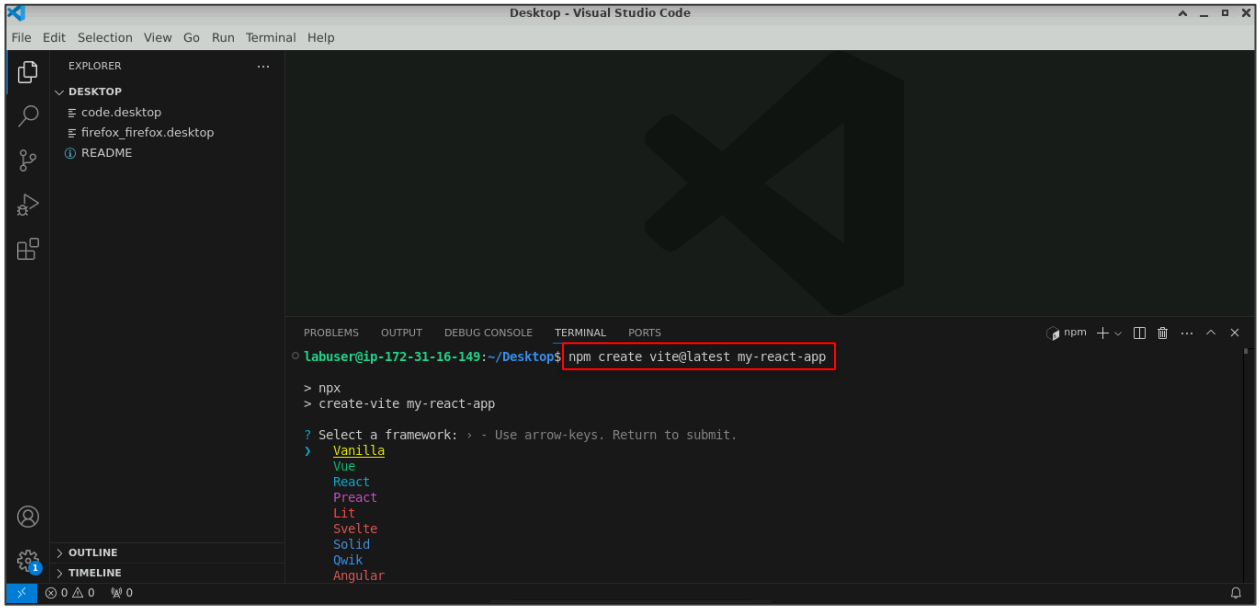
Step 1: Set up a new React project using Vite

1.1 Navigate to VS Code and open the terminal

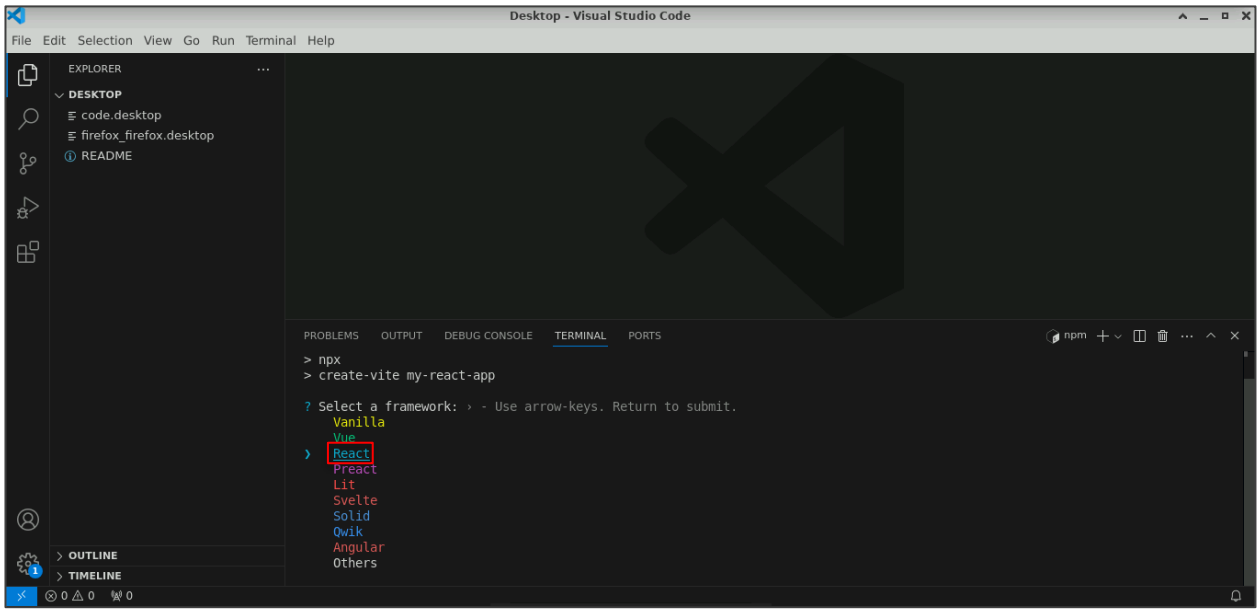


1.2 Run the following command to create a new React project using Vite:

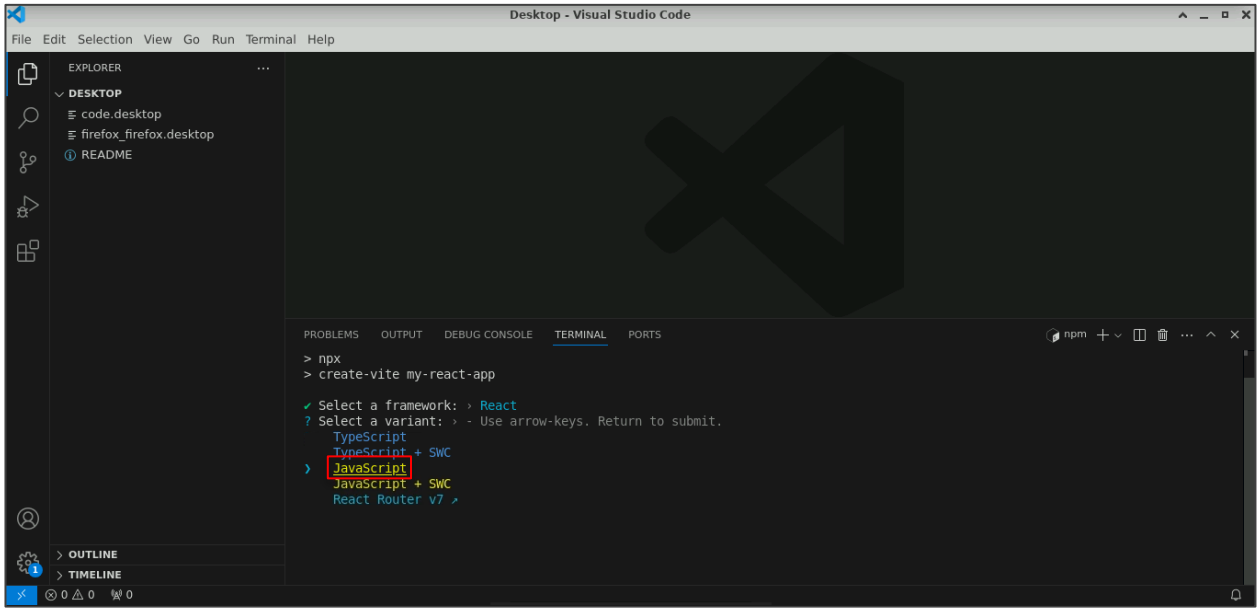
npm create vite@latest my-react-app



1.3 Select **React** and press enter

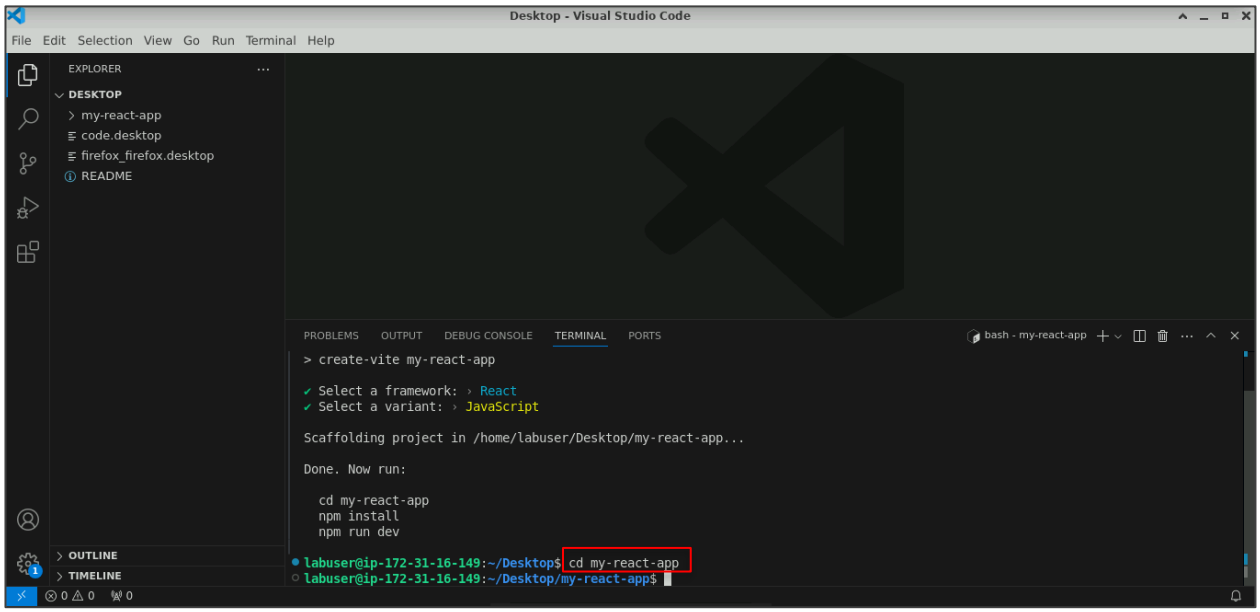


1.4 Select **JavaScript** and press enter



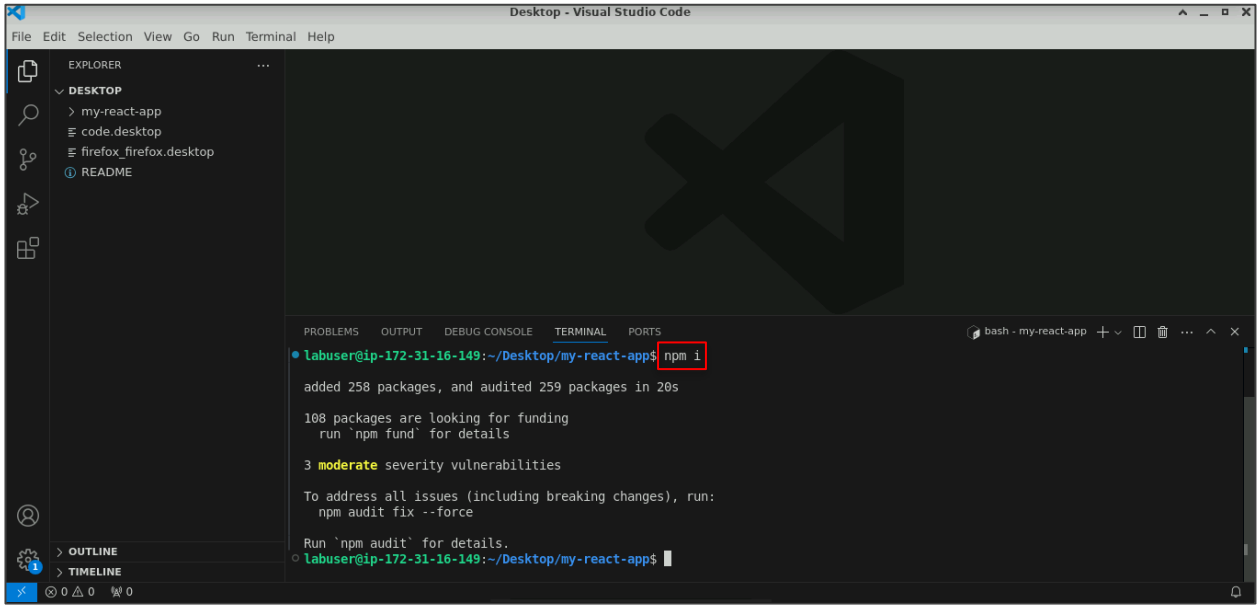
1.5 Run the following command to navigate to the project folder:

cd my-react-app



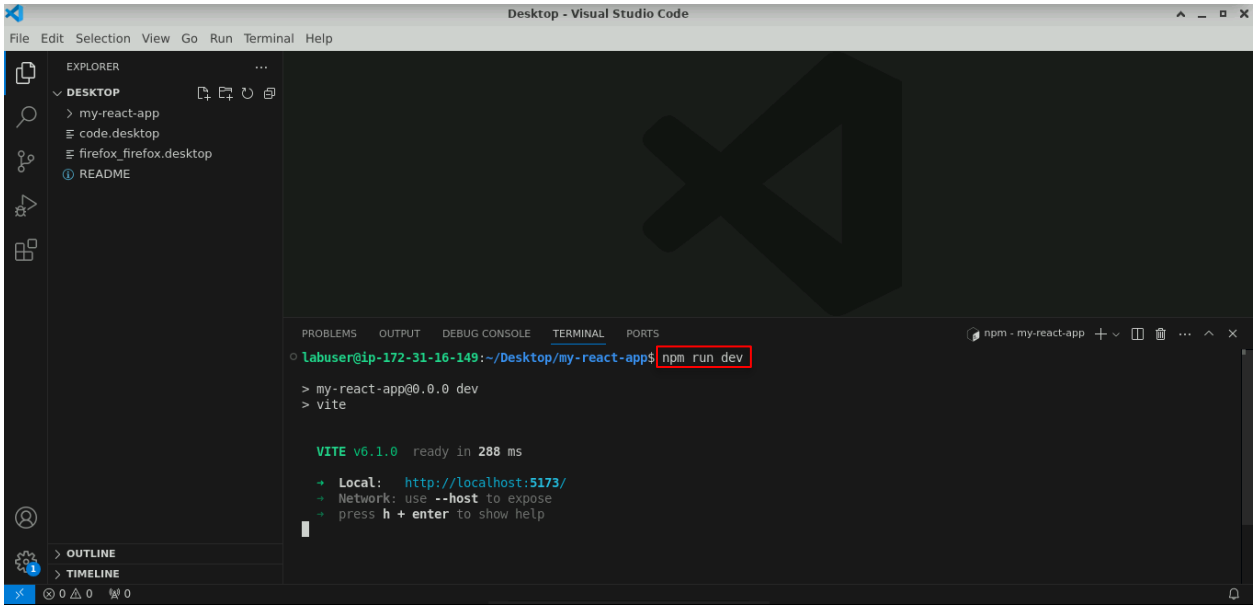
1.6 Run the following command to install dependencies:

npm i



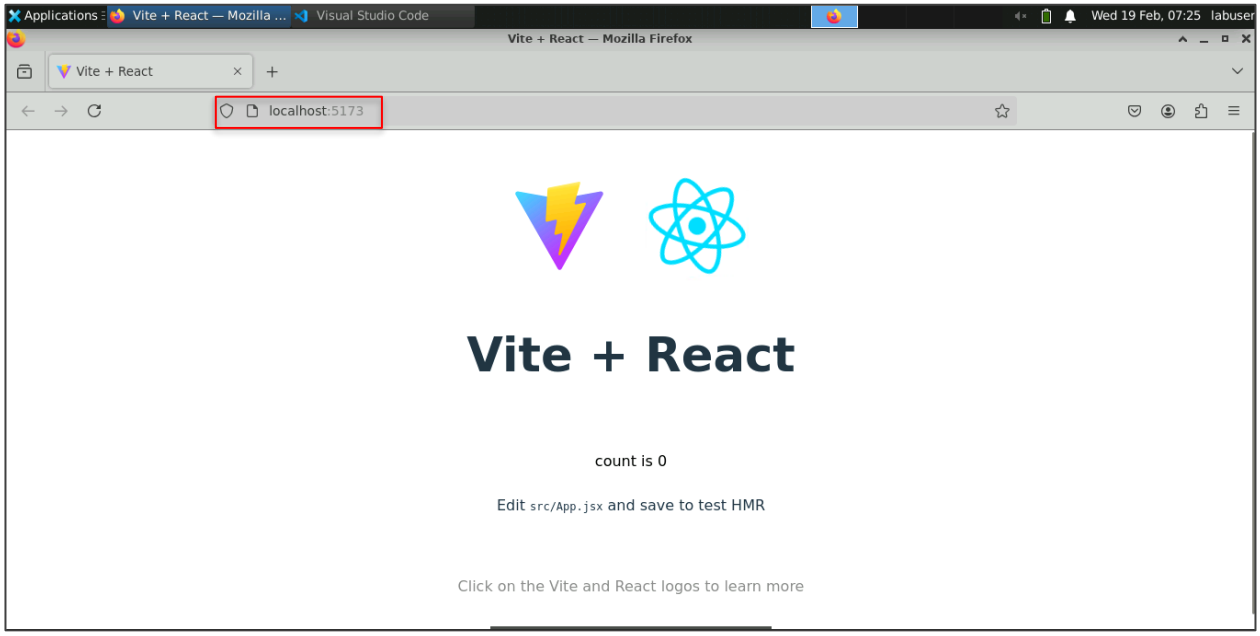
1.7 Run the following command to start the development server:

npm run dev



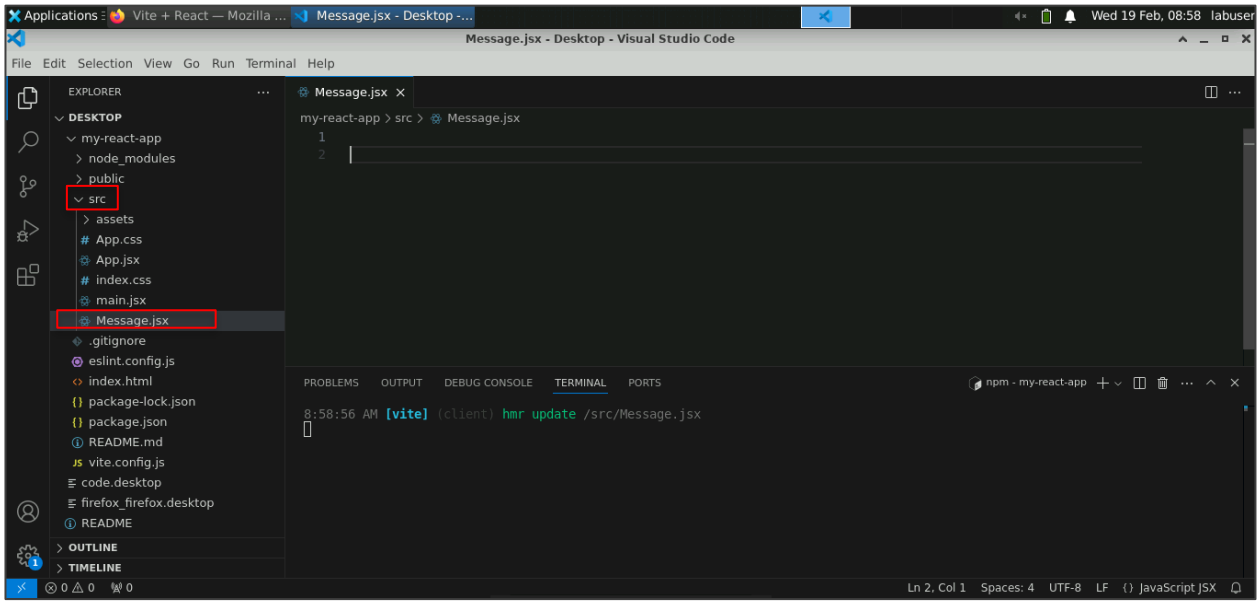
1.8 Navigate to the web browser and paste the link below:

http://localhost:5173



Step 2: Create a React component

2.1 Inside the **src** folder, create a new file named **Message.jsx**

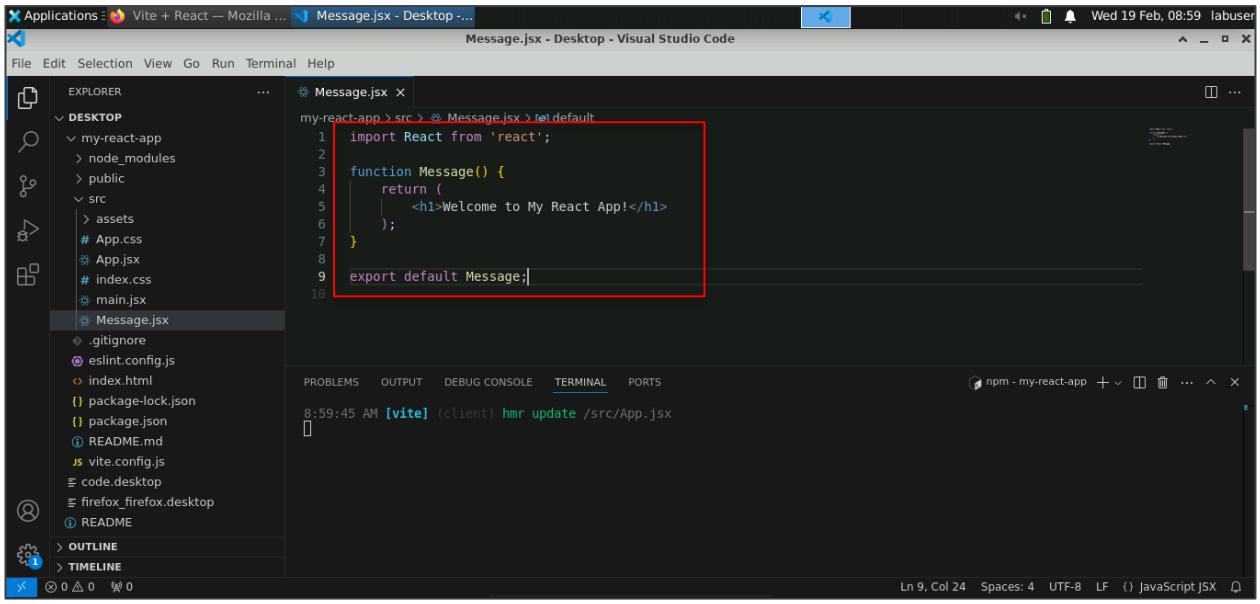


2.2 Add the following code to **Message.jsx:**

```
import React from 'react';

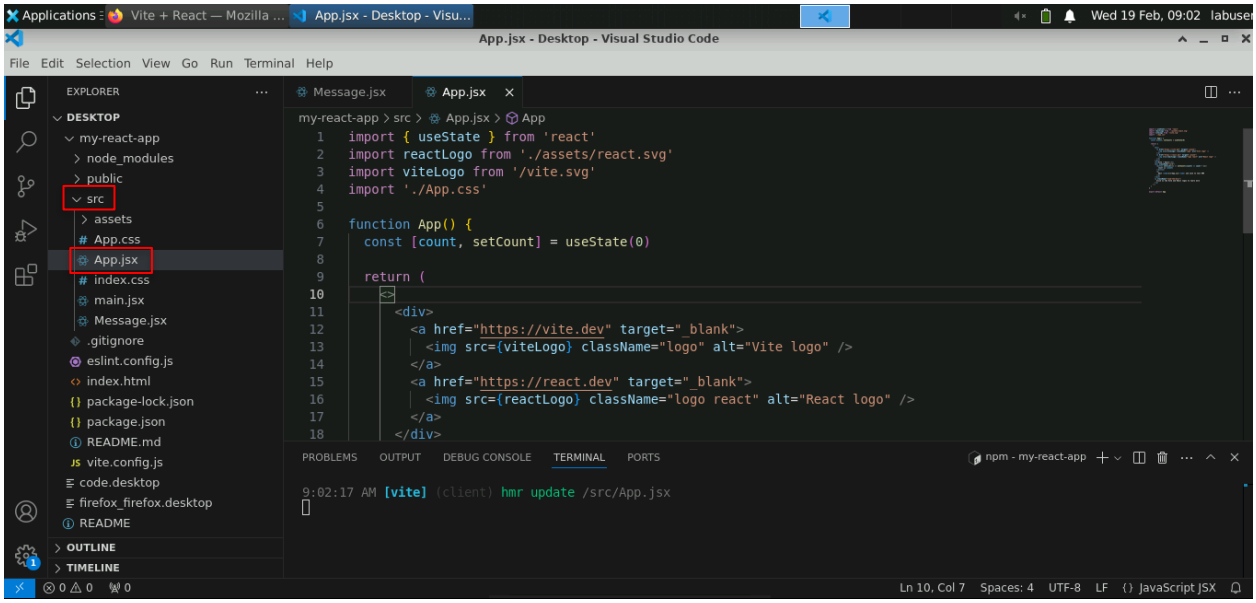
function Message() {
  return (
    <h1>Welcome to My React App!</h1>
  );
}

export default Message;
```



Step 3: Import and use the component

3.1 Open the **App.jsx** file inside the **src** folder

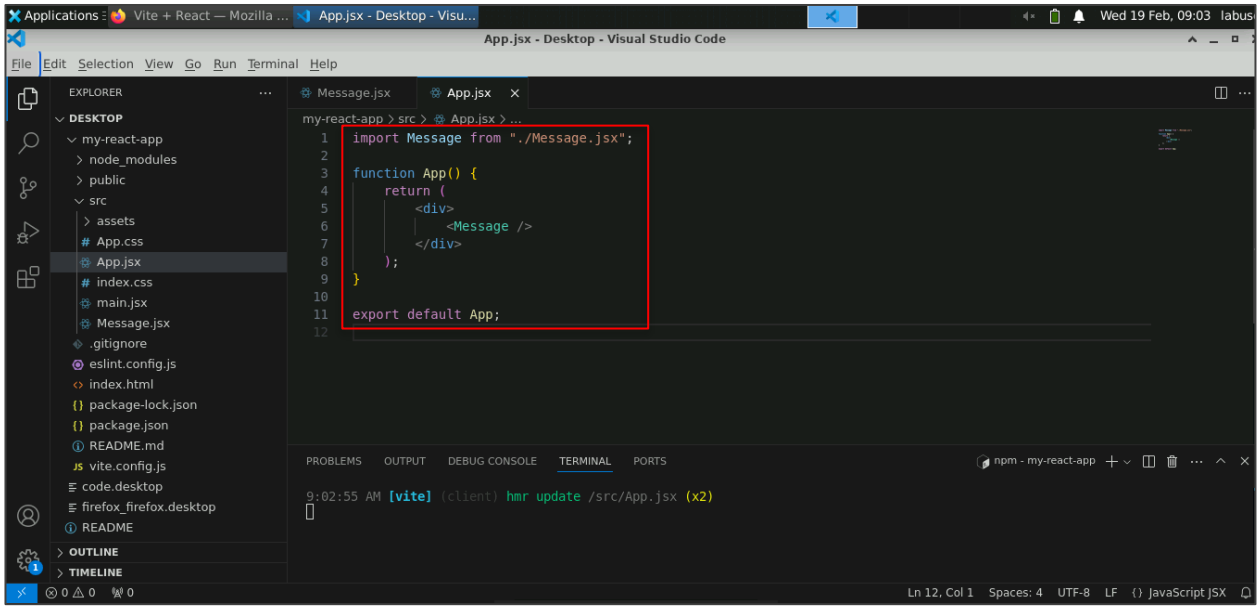


3.2 Paste the code below to include the new component in **App.jsx**:

```
import Message from "./Message.jsx";

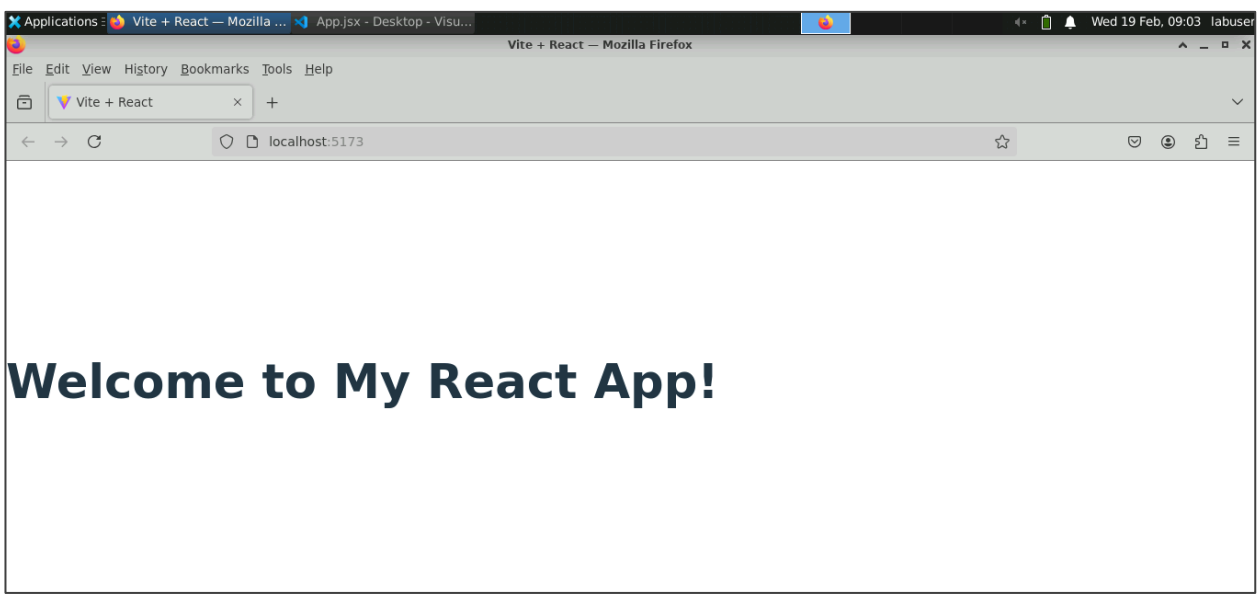
function App() {
  return (
    <div>
      <Message />
    </div>
  );
}

export default App;
```



Step 4: Run and verify the application

4.1 Navigate to the browser and refresh the webpage



Note: Now you will see **Welcome to My React App!** displayed on the screen.

By following the above steps, you have successfully created a React application using Vite and implemented a React component to display a message.
